                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing
specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a single exon nucleic acid probe (SENP) [1] for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be hyperlipoproteinmenia, hyperlipideamia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format discetly from WIPO at the printed specification for the print in the printed specification for wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human peptide encoded by genome-derived single exon probe SEQ ID 36711.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary disease; interstitial lung disease; tuberous sclerosis; gaucher's disease; Niemann-Pick disease; pulmonary histiocytosis; lymphangioleiomyomtosis; karagener syndrome; sarcoidosis; pulmonary histiocytosis; lymphangioleiomyomtosis; karagener syndrome; pulmonary histocytosis; lymphangioleiomyomtosis; karagener syndrome; primary cillary dyskinesis; pulmonary hypertension; hypertension; hypline membrane disease.

The invention relates for a spatially addressable set of single exon uncleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12819 open reading frames derived from the 12619 openes. Also included are a microarray comprising the novel set of probes so in the numan lung; measuring gene expression in a sample derived from human lung; comprising (a) contecting the nucleic acid derived from human lung; measuring gene expression in a sample collection of detectably labeled nucleic acids derived from human lung cand collection of detectably labeled nucleic acids derived from human lung according a evaluation of detectably bound to each probe of the array; identifying exons in a evaluaty bound to each probe of the array; identifying exons in a evaluaty of the exons from genomic sequences of algorithmically predicted and (b) measuring the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe. In the above mentioned microarray; assigning exons to a single exon probe in the above mentioned microarray; assigning exons to a single exon for and (b) measuring the expression of each of the exons in several crassurant the exons in the specification, or encoded by the expression of the exons in the tissues and/or call types using hybridisation to a single exon analysis, and for identifying exons in a gene; particularly using human control of the sexons in a gene; particularly using human control of interestical lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung cancer, chronic obstructive pulmonary disease where a common part expenses of the printed spacefication, but was obtained by asingle exon probe of the invention. Note: The se

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 Con in the specification). ABN15762 to ABN27522 encode the human ORFX proteins given in ABP00010 to ABP11500 ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating of syndrome associated with ORFX-associated disorder. ORFX polymoleotide contract and in the manufacture of a medicament for treating expuences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, catecoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders mellitus, systemic contrapolatical intections munance disorders such as multiple sclerosis, infectious ciscases, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host diseases and autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host diseases and autoimmune thyroiditis, myasthenia gravis, graft-versus-host diseases and autoimmune thyroiditis, myasthenia gravis, graft-versus-host diseases and autoimmune disorders, or periodoral disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting batent did not form part of the printed specification, but was obtained in electronic confirmat directly from WIPO at ftp. hulpo.int/published_pot_escription and electronic confirmat disease.
                                                                                                                                                                                                                                                Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease, diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; SEQ ID NO 15810; 1037pp; English.

The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. antigens. The nucleic acids and proteins are used to prevent, treat (e.g. rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. choplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. Corner of the polypeptides can also be used to aid wound healing and epithelial correct in the polypeptides can also be used to aid wound healing and epithelial corgans before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used to aid wound healing and epithelial corgans before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, correct or also be used as a food additive or preservative to increase or decrease cordinary and expense transplantation to be used to aid distince to increase or decrease experience of diseases and disorders treated by the nucleic acids and expense the particle or preservative to increase or decrease expense and disorders treated by the nucleic acids and protein in the preservative protein remains and protein in the protein r
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotides and polypeptides for diagnosing, treating, preventing or prognosing e.g. diseases or disorders of the nervous, musculoskeletal, excretory, gastrointestinal, reproductive, and respiratory systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins are given in the specification. The present sequence represents a foetal antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 11; SEQ ID NO 1145; 642pp; English

                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a digestive system antigen of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                    Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases.

```
(SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 34
AB0995
gluconate utilization operon repressor [imported] - Salmonella enterica subsp. enterica
C;Species: Salmonella enterica subsp. enterica serovar Typhi
A;Note: this species has also been called Salmonella typhi
C;Becsion: Ab0995
C;Accession: Ab0995

"Identification of an ICP47 homolog in Simian agent 8 (SA8).";

"Identification of an ICP47 homolog in Simian agent 8 (SA8).";

"Identification of an ICP47 homolog in Simian agent 8 associated with antigen processing (TAP), thereby blocking peptide-binding and translocation by TAP as well as subsequent loading of peptides onto MHC class I molecules in the endoplasmic reticulum. In consequence, infected cells are masked for immune recognition by cytotoxic T lymphocytes (By similarity).

"In SUBCELLULAR LOCATION: Cytoplasm (By similarity).

"In DOMAIN: The N-terminal active domain blocks peptide binding to and peptide transport by TAP (By similarity).

"In SUMILARITY: Belongs to the herpesviruses US12 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms

                                                                                                                                                                                                   -i- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
-i- COFACTOR: Binds 2 heme groups noncovalently (By similarity).
-i- SUBNIT: The main subunits of complex b-c1 are: cytochrome c1 and the Rieske protein (By similarity).
-i- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GO:0016021; C:integral to membrane; IEA.

Submitted (DEC-2001) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COFACTOR: Binds 2 heme groups noncovalently (By similarity).

-!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b, cytochrome c1 and the Rieske protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R GO; GO:0016021; C:integral to membrane; IEA.

-:- COFACTOR: Binds 2 heme groups noncovalently (By similarity)
-:- SUBUNIT: The main subunits of complex b-c1 are: cytochrome
cytochrome c1 and the Rieske protein (By similarity).
-:- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..
